Target version:	M3		
Description			
<p>Hi, I'm trying to look at issues related to income. There is a variable <code>c_prfitba</code> which is the "total personal income annually". This seems like an obvious variable but for 97.82%, the answer is "inapplicable". Obviously far more than 2% of people have a personal income. Can anyone clarify what is going on?</p> <p>Regards, Greg Hines</p>

Hi Greg,

the question was part of the proxy interview and there are not that many in Understanding Society.

You can find out who a question was applicable to by checking the universe information in the questionnaire, and by looking at the variable level description in the online dataset documentation.

https://www.understandingsociety.ac.uk/documentation/mainstage/dataset-documentation/wave/3/datafile/c_indresp/variable/c_prfitba

The User Guide, section 3.8, also has a detailed description of which income variables are provided in the study data. Is there an indicator that is more suitable for your analysis?

Best wishes,
Gundi
